

Sinclair ZX80

Announced:	February 1980
Available:	Late 1980
Price:	£99.95 / US\$199.95
How many:	50,000
Weight:	12 ounces
CPU:	Zilog Z80A @ 3.25MHz
RAM:	1K, 64K max
Display:	22 X 32 text hooks to TV
Ports:	memory, cassette
Peripherals:	Sinclair thermal printer
OS:	ROM BASIC

For just \$199.95, you can get a complete, powerful, full-function computer, matching or surpassing other personal computers costing several times more.

The Sinclair ZX80 is an extraordinary personal computer, compact and briefcase sized, it weighs just 12oz, yet in performance it matches and surpasses systems many times its size and price.

The ZX80 is an advanced example of microelectronics design. Inside, it has one-tenth the number of parts of existing comparable machines.

In 1980, British company Sinclair released their ZX80 computer for £99.95 (British pound available in the United States, it is considered to be the world's first computer for under U that's what Sinclair Research Ltd stated in all of their ads.

At the bottom of the [magazine advertisements](#) was an order form: "Please send me ___ Z computer(s) for \$199.95 each ..."

The ZX-80 was designed with only the base necessities - the shelf components - there are no custom or proprietary parts involved.

An external cassette drive, typical of the era, is the only way to load and save programs.

Even cheaper at £75.95 in a kit form, the inexpensive Sinclair ZX-80 introduced many people to the computer world who might otherwise have stayed away from computers due to the perceived high prices of other albeit more capable computer systems.

The ZX80 was an amazing

1978	Netronics ELF II IBM 5110

product - a real useable computer for only \$200.00. But it did have it's drawbacks:

- No color support
- No sound support
- Very limited memory
- The built-in BASIC programming language can deal only with whole numbers
- Very slow program execution - there are no video chips, the CPU performs all of the computer functions
- The keyboard is a membrane-type, a flat plastic surface which is difficult to use and wears-out rather quickly

Sinclair sold 50,000 ZX80s before they came out with the improved [ZX-81](#) one year later. The ZX-81 was much cheaper, at only \$99.95, the first computer for under \$100. The ZX-81 had only 5 IC chips, compared to the ZX80's 21 chips.

In 1982, American company Timex started selling the ZX-81 in America, calling it the [Timex Sinclair 1000](#).
